

The Trilogy Virtual Panel

Stay connected...
Wherever you are!

Smartphone, tablet or PC... ...take advantage of a whole new level of flexibility

The all new Trilogy Virtual Panel is a software application which installs on a variety of devices such as smartphones, tablets, desktop PCs & laptops, supporting a range of popular platforms (Windows, Android, iOS and Java enabled web browsers). This cutting-edge application brings a whole new level of flexibility and cost effective access points into a powerful intercom system - just choose your favourite device and platform, install the application and go!

Designed with flexible work solutions in mind, the Virtual Panel enables remote users to access the full audio capabilities of the intercom system from anywhere, at any time, and be up and running in minutes without the need for dedicated operator hardware. Individual users will access the intercom via a familiar, modern software panel on the chosen device and a VoIP connection over standard TCP/IP networks (either wired, wireless or a combination of both). Having the audio managed by a VoIP connection means the panel users are truly flexible as there is no physical connection to any dedicated hardware - it's all in the cloud.

Panel users will have access to multiple simultaneous voice channels for direct and conference style communications. Calls to and from radios, other phones and other voice technologies connected to the intercom

system are also supported from the device running the Virtual Panel, allowing full integration with legacy systems and hardware.

The Virtual Panel offers the ultimate flexibility with fast deployment, lower logistics and reduced maintenance costs, allowing users access to the system when and where they need it.

Key Features

- Turns your chosen device into a fully featured intercom panel
- Connect up to 12 users on a single Gemini, Messenger or Mercury host
- The ideal solution to extend your system for ad hoc users and special events
- Fast access for private, group and conference communications

Note: The Virtual Panel is best run on devices such as Google Nexus due to the minimal latency experienced by these Android devices.
